

PROJECT TITLE: Extending re-order (Re-organising care for depression and related disorders in the Australian Primary Care setting) - Tasmanian and cross-cultural component

INVESTIGATORS: Professor Jane Gunn, Dr Renata Kokanovic, Prof Christopher Dowrick, Prof Helen Herrman, Dr Emily Hansen, Dr John Furler

The proposed study builds upon our existing Stream 3 **re-order** project, which aims to inform a change in the way we think about, organise and deliver depression care in Australian primary care in a way that is directly relevant to policy and practice. **Re-order** uses a proactive evaluation framework and action research methods to lead to innovation in the organisation and linkages within primary care for the management of depression and related disorders. The proposed Stream 5 work addresses culture, equity, crosses geographical boundaries and enables the **re-order** research team to move more quickly to disseminating findings and changing practice. The cross-cultural component reflects the diversity of the Australian population and proposes work in an area that is usually neglected (depression in CALD groups). By crossing State boundaries to cement interstate collaboration between Victoria and Tasmania we expand the APHCRI network and increase the generalisability of our subsequent research findings. By engaging additional research staff we create the capacity to undertake our research in a shorter timeframe and move more quickly to the dissemination work with policy, practice and to the completion of traditional research outputs of presentation and publication.
